

Project Design Phase
Proposed Solution Template

Date	10 July 2026
Team ID	
Project Name	Virtual Agent-Driven SLA Breach Awareness & Justification System
Maximum Marks	2 Marks

Proposed Solution Template:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Organizations often struggle to monitor Service Level Agreements (SLAs) effectively. Manual tracking of SLA status may result in delayed responses, missed deadlines, SLA breaches, and reduced customer satisfaction. There is a need for an automated system that continuously monitors SLA progress, detects potential breaches, alerts stakeholders in advance, and records valid justifications for SLA violations.
2.	Idea / Solution description	The proposed solution is a Virtual Agent-Driven SLA Breach Awareness & Justification System built on the ServiceNow platform. The system automatically monitors SLA progress, identifies incidents approaching SLA breach thresholds, marks them as "SLA At Risk," notifies the assigned users through email and virtual agent interactions, collects breach justification, updates incident records, and provides dashboards and reports for monitoring SLA performance.
3.	Novelty / Uniqueness	Unlike traditional SLA monitoring systems that mainly provide static reports, this solution combines real-time SLA tracking, proactive breach prediction, automated notifications, Virtual Agent assistance, justification capture, and performance analytics within a single integrated ServiceNow application. This improves operational efficiency and enables faster issue resolution.
4.	Social Impact / Customer Satisfaction	The system helps organizations improve customer satisfaction by reducing SLA violations, ensuring timely incident resolution, increasing service transparency, and promoting accountability. Automated alerts and justifications enable support teams to respond proactively, resulting in better service quality and stronger customer trust.
5.	Business Model (Revenue Model)	The solution can be offered as a ServiceNow application or enterprise solution under a subscription-based Software-as-a-Service (SaaS) model. Organizations may subscribe annually or monthly based on the number of users or incidents managed. Additional revenue can be generated through customization, implementation services, maintenance, training, and technical support.

6.	Scalability of the Solution	The solution is highly scalable and can be deployed across organizations of different sizes. It supports multiple departments, business units, SLA policies, and thousands of incident records simultaneously. Future enhancements can include AI-based breach prediction, machine learning analytics, predictive reporting, multilingual Virtual Agent support, and integration with external IT Service Management (ITSM) platforms.
